NOTICE OF CHANGE

SPLIT FLANGE KITS

Anchor Fluid Power is making a change in how our standard carbon steel split flange kits are supplied. We will now supply hardened flat washers in place of the split ring (lock) washers we have previously supplied.

This change is recommended by the manufacturing specification SAE J518 and was made in consideration of surface pressure between fastener head and flange, recommended torque values and redesigned bolt hole diameters that allow for use of both metric and UNC fasteners.

As an alternative, lock washers may be supplied upon request at an additional cost and are subject to lead time at time of order. This will be a rolling change that is starting with metric kits and will conclude with UNC kits.

Please contact Anchor Fluid Power if additional information is required.
